

Anthrax

Anthrax is a disease caused by the bacteria *Bacillus anthracis* that can infect all warm-blooded animals, including humans. Anthrax can be found naturally in soil and affects domestic and wild animals. Anthrax is rare in the United States, but sporadic outbreaks do occur in wild and domestic grazing animals such as cattle or deer. Anthrax disease in people primarily affects those who work certain jobs, such as those exposed to dead animals and animal products like wool, hides, and hair.

Transmission

Anthrax bacteria can live in the soil for many years in the form of a spore. A spore is a bacterium that is dormant because its environment is not good for growth and/or reproduction. People may become infected with anthrax by:

- **Inhaling** anthrax spores.
- **Handling hair, hides, or wool** from diseased animals.
- **Eating undercooked meat** from diseased animals.

Anthrax is not contagious, which means you cannot catch it from another person. It is unknown if anthrax infection provides immunity; however, reinfections of this disease are rare.

Symptoms

The symptoms will vary depending on how a person was exposed to the bacteria.

- **Respiratory exposure**, symptoms may include fever, chills, cough, shortness of breath, nausea, vomiting, headache, sweats, confusion, dizziness, extreme tiredness, or body aches. Illness may progress to severe breathing problems and even death.
- **Gastrointestinal exposure**, may include abdominal cramps, nausea, vomiting, sore throat, painful swallowing, headache, swelling of neck or neck glands, hoarseness, fever, diarrhea, stomach pain, and can progress to sepsis, or death.
- **Skin exposure**, a boil-like sore may appear that eventually forms a black center. Swelling of the lymph glands under the arm and fever also may occur.

If you have symptoms of anthrax, it's important to get medical care as quickly as possible to have the best chance of a full recovery.

Diagnosis

Diagnosis will depend on the type of anthrax infection a person has. Laboratory tests can be done on blood, spinal fluid, skin biopsies, etc. and are available to aid health care professionals with the diagnosis.

Treatment

Anthrax can be treated with antibiotics. Make sure to follow all directions when taking antibiotics to reduce the chance of relapse and developing antibiotic-resistant strains. Antitoxin may also be used for treating severe

anthrax illness. For more information about the treatment of anthrax, contact your health care provider or visit www.cdc.gov/anthrax/treatment/index.html.

Prevention

The best way to reduce their risk of getting anthrax is to **carefully handle dead animals suspected of having anthrax**. When processing or working with animal hides and other animal products, always work in an area that has good ventilation. Vaccinating livestock will further reduce the risk of exposure to infected animals and animal products; check with a licensed veterinarian about animal vaccinations.

Anthrax vaccine is not available to the public. However, it is available to those in high-risk occupations, such as:

- People who work **directly** with the anthrax bacteria in laboratories
- People who work with **imported animal hides or furs** in areas where work standards are insufficient to prevent exposure to anthrax spores
- People who handle **potentially infected animal products** in high-incidence areas; while incidence is low in the United States, veterinarians who travel to work in other countries where incidence is higher should consider being vaccinated
- Military personnel deployed to **high-risk** areas

Exclusion Guidance

People should not be excluded from child care, school, work, or other activities unless the [general exclusions apply](#).

For more information about anthrax or anthrax exposures, contact North Dakota Health and Human Services' Public Health Division at 800.427.2180, 711 (TTY).

This disease is a reportable condition. North Dakota law requires reporting any incidence of this disease to North Dakota Health and Human Services.
